

UI Number input

Olusola Olaoye

On the unity asset store

Introduction

UI number input is an asset that allows you to give useful functionalities to number based input fields with increment and decrement buttons. Functionalities include

- Increment or decrement action when the user long-clicks on the buttons of the number field
- Customization of decimal places,
- Speed at which the number will increment or decrement on long click
- Speed at which the number will increment or decrement on mouse drag
- Customization of mouse drag axis
- Cursor change which allows the user to know which mouse drag axis will affect the number change

This package is very handy for a lot of unity projects and it also works on mobile devices as well.

Set-up and Usage

Use the 2 demo scenes as examples. One demo scene is dark mode based while the other is light mode based. Whenever you need a new "Number input" object, simply create one by right-clicking on the hierarchy panel, and select a number input under the "Number input" option. You can also click on the "Game object" menu option and select a type of number input under the "Number input" option. Read the tooltip for each variable in the number input component which will be attached to the number input gameobjects.
